Summary

Under a Memorandum of Understanding, the National Institute of Agrobiological Sciences (NIAS) of Japan and the National Agriculture and Forestry Research Institute (NAFRI) of the Lao People's Democratic Republic (Lao PDR) have collaborated since 2006 to survey plant genetic resources in Lao PDR. The main objective of the current survey was to collect samples of eggplant (*Solanum melongena* L.) and related crop species from the northwestern provinces of Luang Namtha and Bou Keo, in Laos. From 7th to 23rd November, 2016, we collected a total of 108 samples, including 91 of *S. melongena* and 17 of other *Solanum* species. We discovered a wide diversity of eggplant landraces showing strong variation in fruit shape (cylindrical, ellipsoid, ovoid, and globular), length (9 - 212 mm), and color (purple, green, and white); spineless landraces were common. Seeds of these genetic resources will be produced by self-pollination, and NAFRI staff will evaluate the characteristics of the materials during the next season. The seeds produced at NAFRI will be shared between Laos and Japan. We plan to evaluate morphological characteristics and resistance of the accessions to *Verticillium* wilt, bacterial wilt, *Fusarium* wilt, and nematodes in Japan.

KEY WORDS: *Solanum*, eggplant, Laos, NAFRI, HRC, NIAS, NIVFS

Introduction

Under a Memorandum of Understanding, the National Institute of Agrobiological Sciences (NIAS) of Japan and the Horticulture Research Center (HRC) of the National Agriculture and Forestry Research Institute of the Lao People's Democratic Republic (Lao PDR), have collaborated since 2006 to survey plant genetic resources in Lao PDR as part of the NIAS Genebank Project. This report describes the findings of the sixth survey under this Memorandum, which is also the third survey in the PGRAsia project of the Ministry of Agriculture, Forestry and Fisheries of the Government of Japan, to collect vegetable plant genetic resources. Reports of the surveys conducted in 2007, 2008, 2009, 2014, and 2015, have been published (Sakata *et al.* 2008; Saito A *et al.* 2009; Matsunaga *et al.* 2010; Saito T *et al.* 2015, 2016). In 2014 and 2015, 134 and 124 samples of eggplant (*Solanum* spp., including wild relatives) were collected from the northern provinces of Houaphan, Xiengkhouang, Oudomxay, and Phongsaly in Lao PDR. Northwestern Lao PDR is a mountainous region (Photo 1) which is home to many ethnic minorities; at least 48 ethnic tribes live in Lao PDR (Chamberlain and Phomsombath 2003). The logistics of reaching and interacting with minorities are difficult; thus, it is likely that many undescribed landraces are maintained in this region. In this survey, we collected new samples from many villages in the northwestern provinces of Luang Namtha and Bou Keo.

Methods

Before the survey, Dr. Sisaphaithong collected information on eggplant genetic resources in the provinces of Bou Keo (Bokeo) and Luang Namtha (Fig. 1). Based on this information, we surveyed the area from 7th to 23rd November, 2016 (Table 1). We rented a car (Photo 2) to visit local markets (Photo 3) and farmer stalls (Photo 4), homes (Photo 5), and fields to obtain samples of fruits or seeds, focusing on landraces. After confirming a site location by GPS, we gathered samples and interviewed people to collect information about the samples, such as the local name, usage, and area of cultivation (Photos 6 and 7).

On 8th November, we visited the HRC and explained the objectives and plan of our survey to the Deputy Director, Mr. Souvanh Thadavong, and staff members (Photo 8). On 21st November, we revisited the HRC, extracted seeds from the collected materials (Photo 9), and reported our preliminary results (Photo 10).

Results

We traveled and surveyed nearly 3,000 km (Table 1) and collected a total of 108 samples from 8 districts (24 villages) in 2 provinces (Table 2). The collected plant materials comprised 91 samples of *Solanum melongena* L., 10 of *Solanum aethiopicum* L., 1 of *Solanum torvum* Sw., 1 of *Solanum macrocarpon* L., and 5 of *Solanum violaceum* R. Br. (Table 3), from 11 ethnic tribes (Table 4). Following the survey, the seeds were kept at the HRC. After the seeds are propagated and the plant materials are characterized, the seeds will be shared equally between the NIAS Genetic Resources Center (NIAS GRC, now NARO GRC) and the HRC.

The remainder of this section describes the day-to-day details of our survey. All the collected samples were mature fruits, unless otherwise specified.

9th November: We traveled from Vientiane, via Van Vieng, Kasi, and Poungdong, to Luang Prabang on Routes 10, 13N, unnumbered, 4, and 13N. The road conditions between Vientiane and Van Vieng were

Table 1. Itinerary followed during the 2016 survey in northwestern Lao PDR

Date	Day	Itinerary	Stay	Distance covered (km)
7-Nov	Mon	Chubu 11:00 (TG645) -- 15:40 Bangkok 19:35 (TG574) -- 20:45 Vientiane	Vientiane

Total		24	91	10	1	1	5	108

bad: asphalt was missing in some places, and most parts of the road were uneven and bumpy. Although we visited several small markets along the way, nothing was collected because only commercial eggplant cultivars (for example, Photo 3) were offered. The journey took about 9 h.

10th November: We traveled from Luang Prabang, via Pakmong, Oudomxay, and Na Teuy, to Luang Namtha on Routes 13N, 13B, and 17A. Although we visited several small markets along the way, nothing was collected because only commercial eggplant cultivars were offered. The journey took about 8 h. Chinese-owned plantations that export common bean (*Phaseolus vulgaris*) to China have recently increased in this area (Photo 11); therefore, the production of traditional upland rice and vegetables has decreased,

causing concern among farmers.

11th November: We visited a small market in the village (ban) of Ban Namchang (Photo 3), where we collected information on eggplant production and one sample (No. 1). Then we visited the Province Agriculture and Forestry Office (PAFO) of Luang Namtha and explained our plans and objectives to the Head of Agriculture, Mr. Phimkeo Thamlasinh (Photo 12). The Head assigned a PAFO staff member to assist our survey of Luang Namtha province, and various staff members of the District Agriculture and Forestry Office (DAFO) to assist the district surveys. In Ban Phon Saksayan, we collected two accessions (Nos. 2 and 3). Two more samples (Nos. 4 [*S. melongena*] and 5 [*S. torvum*]; Photos 13 and 14) were collected at a nearby house, where they were grown for home use. The farmer reported that fruit with a spineless calyx was usually eaten raw, and that fruit with a spiny calyx was cooked. In Ban Naleu, we collected five samples (Nos. 6-10), including *S. aethiopicum* (No. 8) and *S. violaceum* (No. 10, photo 15). In Ban Namtung, we collected eight samples (Nos. 11-18) from two houses (Photos 16-18). We traveled from Luang Namtha to Vieng Phouka via Routes 17A and 3. A DAFO staff member of Vieng Phoukha District joined us (Photo 19). In Ban Vieng Savang, we surveyed (Photo 20) and collected five samples (Nos. 19-23), including *S. violaceum* (Nos. 21 and 22, Photos 21 and 22) and *S. aethiopicum* (No. 23, Photo 23). In Ban Nam Par, we collected eight accessions (Nos. 24-31, Photo 24), including *S. violaceum* (No. 28, Photo 25). On the way to Luang Namtha, we collected two samples (Nos. 32 and 33) from a farmer field. In Ban Vieng Savang, we collected two samples (Nos. 34 and 35, Photo 26). The color underneath the calyx of collection No. 34 was dark purple, which suggests that the skin pigment is tulipanin (Azuma *et al.* 2008). Back in Luang Namtha we extracted seeds from collected rotten fruits (Photo 27).

12th November: We collected one sample (No. 36), which showed high yield and produced non-bitter fruits, behind a gasoline station in Ban Vieng Gent. A PAFO staff member joined us there. We traveled from Namtha district to Sign district on Route 17A. The journey took about 2 h. In Ban Nang Bou, we collected six samples (Nos. 37-42), including *S. aethiopicum* (No. 41, Photo 28). We went to other villages off the main road. The road conditions were bad, most of it was unpaved, uneven, and bumpy. In Ban Lank Khame (Photo 7), we collected nine samples (Nos. 43-51), including a rotten fruit (No. 50, Photo 29) and a mature fruit given to us by a farmer. After lunch, we collected two samples (Nos. 52 and 53) in Ban Nam da Mai, near the border with China (Photo 30). This village featured large Chinese-owned banana plantations (Photo 31). On the way back to Namtha, we collected one *S. aethiopicum* sample (No. 54, Photo 32) at a small market in Ban Lak Khane Mai Kh (Photo 4), and three samples (Nos. 55-57) at another small market in Ban Nam Mant.

13rd November: The same PAFO staff member joined us at the aforementioned gasoline station. We traveled from Luang Namtha to Nalae via Route 3 and a small road alongside a river. The road conditions were bad, most of it being unpaved, uneven, and bumpy. The journey took about 2 h. In Ban Hat Na Leng, we surveyed (Photo 1) and collected seven samples (Nos. 58-64, Photos 33 and 34). In Ban Pou Phat, we collected three smoked samples (Nos. 65-67) from a farmer (Photo 35). We visited a few villages and small shops near the river, but we could not collect eggplant samples. In this area, vegetables were usually planted together with upland rice. Eggplant seeds were stored in warehouses in an upland rice field far from farm houses.

14th November: We traveled from Luang Namtha to Huay Xay via Route 3. The journey took about 5 h. In Huay Xay, we visited a market and collected information on eggplants. We extracted seeds from rotten fruits that we had collected and put dried seeds into paper bags. We then sorted data and photographs.

15th November: We visited the PAFO at Bou Keo and explained our plans and objectives to the deputy director (Photo 36). In Ban Noung Khon we collected six samples (No. 68-73), including *S. violaceum* (No. 69, Photo 37) and *S. aethiopicum* (Nos. 72 and 73, Photo 38). In Ban Peion Sain we collected two samples (Nos. 74 and 75). In Ban Dand Poue we collected five samples (Nos. 76-80), including *S. macrocarpon* (No. 76); the leaves of this accession are popular in the preparation of the traditional Lao dish *larb*. We revisited the PAFO and explained our plans and objectives again to the director, Mr. Chanpheng Aintavong (Photo 39). The director assigned one PAFO staff member to assist our survey in Bou Keo province, and various DAFO staff members to assist our surveys in the district. In Ban She Meunggen, on the way to Donsao (Photo 40), near the borders with China and Myanmar, we collected three samples (Nos. 81-83, Photo 41).

16th November: We traveled from Huay Xay to Meung via Route 3 and a small road. The road conditions between Phimonsin and Meung were bad. The journey took about 3 h. We visited the DAFO of Meung District and explained our survey (Photo 42). A DAFO staff member joined us (Photo 43). In Ban Larn Khoum Meung, we collected three accessions (Nos. 84-86), including *S. aethiopicum* (No. 86). This area is famous for tea and sake. In Ban Phoum Savang, we collected five samples (Nos. 87-91, Photo 44), including *S. aethiopicum* (No. 91). In Ban Nam Meung, we collected four samples (Nos. 92-95). The parent plant of one sample (No. 92) was 2 years old. Many plants were 2 or 3 years old. In Ban Houay Tant, we collected one *S. aethiopicum* sample (No. 96).

17th November: We traveled from Huay Xay to Pha Oudom. The road conditions were good. The journey took about 3 h. We visited the DAFO of Pha Oudom District and explained our survey (Photo 45). In Ban Pang Thoung, we collected eight samples (Nos. 97-104), including smoked fruits (Nos. 101 and 102, Photo 46). At the market we saw a commercial cultivar from Thailand with a higher price, but no better taste than a landrace from nearby. Usually the former is used in papaya salad and the latter in *larb*. In Ban See Boun Houng we collected four samples (Nos. 105-108).

18th November: We returned to Luang Prabang on Routes 3, 13B, and 13N. The journey took about 11 h. Later, we extracted the seeds from rotten fruits.

19th November: We sorted data and photographs. We then traveled from Luang Prabang to Vang Vieng via Poungdong and Kasi on Route 4 and 3, a new road.

20th November: We traveled from Vang Vieng to Vientiane via Thahua, Phonhong, Naxay Kang, and Tha Ngon, on Routes 13N and 10. The journey took 4 h.

21st November: We sorted data and photographs in the morning, and returned to the HRC in the

afternoon to report our preliminary results. The HRC members of our team extracted seeds from the collected fruits and dried them. We finished with a farewell dinner (Photo 47).

Discussion

The rainy season in northern Laos is usually over by the end of October, but rain continued for the first few days of the survey. If this was an effect of climate change, we will have to reassess the period for exploring eggplant genetic resources in Lao PDR.

Our collection of seeds from numerous eggplant landraces was facilitated by the widespread availability of mature fruits in gardens, fields, and markets, as we found in Houaphan and Xiengkhouang provinces in 2014 (Saito T *et al.* 2015), and in Oudomxay and Phongsaly provinces in 2015 (Saito T *et al.* 2016). We were unable to communicate directly with the different ethnic groups, but the PAFO and DAFO staff who assisted our work acted as translators. In other countries, generally the flesh and skin of immature eggplants are eaten. However, we found that in northwestern Laos, people also eat the skin, but not the flesh of mature fruits. We discovered that eggplants from Luang Namtha and Bou Keo vary widely in shape (cylindrical, ellipsoid, ovoid, and globular; Fig. 2), length (9 - 212 mm), and skin color of immature fruits (purple, green, and white; Table 4), and that spineless landraces were popular, as in Houaphan, Xiengkhouang, Oudomxay, and Phongsaly. We will test the genetic diversity among the samples using DNA markers.

Although we focused on *S. melongena*, we also collected samples of *S. aethiopicum* (formerly *S. gilo*), *S. torvum*, *S. macrocarpon*, and *S. violaceum*. These species are primarily used for medicine, although they are also edible. Laotians sometimes eat the raw fruits, but we found them too bitter.

We observed many large plantations managed by Chinese capital, where farmers used inorganic fertilizers, pesticides, and seeds imported from China (Photo 48). The PAFO and DAFO staff told us that they were worried about the environmental harm caused by these chemicals (personal communication from staff). Many Laotians prefer organically grown foods, and the number of organic farmers is increasing.

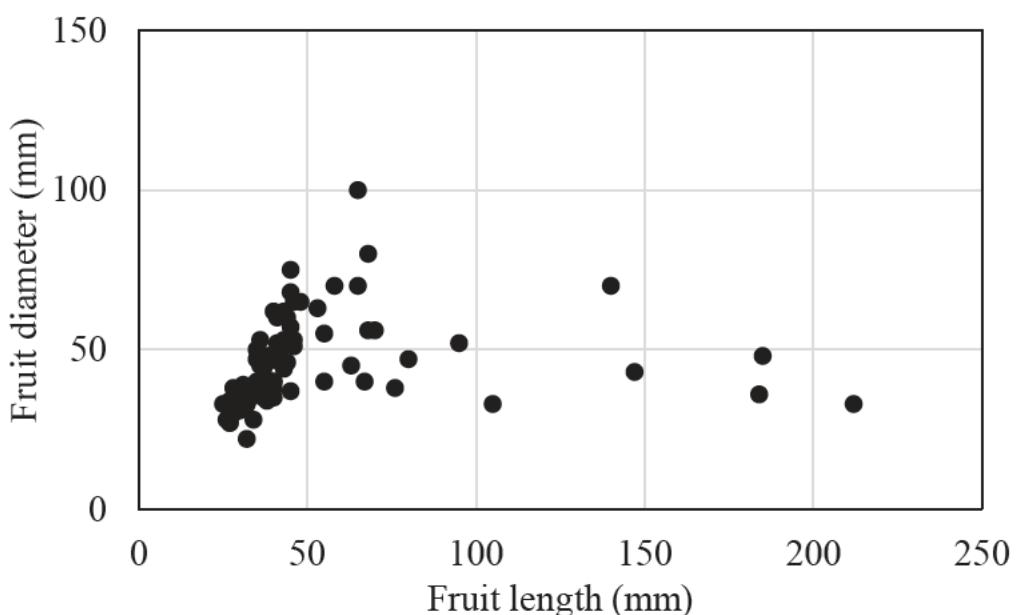

Fig. 2. Shape distribution of 88 *Solanum melongena* accessions (excluding Nos. 65-67) on a scatter plot of fruit length versus diameter.

However, it is difficult to grow organic crops unless new cultivation methods and improved cultivars are adopted. The HRC staff wants to breed new cultivars that are resistant to diseases and insects, produce high yields with less fertilizer, and are suitable for organic cultivation.

We discussed and planned future collaborations with the HRC staff, and we plan to cooperate with them to evaluate eggplant genetic resources and breed new cultivars. Seeds collected in the present field study will be produced by self-pollination, and the HRC staff are going to evaluate the materials in the next season. The seeds produced at the HRC are to be shared between Laos and Japan. We also plan to evaluate the morphological characteristics and resistance of the accessions to *Verticillium* wilt, bacterial wilt, *Fusarium* wilt, and nematodes in Japan.

Acknowledgments

This work was supported by a grant (PGRAsia Project) from the Ministry of Agriculture, Forestry and Fisheries of the Government of Japan.

和文摘要

本報告は、独立行政法人農業生物資源研究所とラオス農林省との間で2006年に締結した共同研究協定（MOU）に基づいて行われたラオス国における2016年の野菜遺伝資源の調査報告である。調査は、2016年11月7～23日にかけ、ナスを主な調査対象とした。今回は、ラオス国北部地域であるルアンナムタ県およびボケオ県を調査した。ナス栽培種 *Solanum melongena* を91点およびナス近縁種を17点の合計108点の種子サンプルを収集した。当該地域におけるナスの多様性は高く、果形や果色に広い変異が観察され、とげなし性の在来種が多かったことは興味深い。これら遺伝資源の種子は自殖によって増殖し、ラオス園芸研究センター（HRC）で特性調査が行われる予定である。将来的には、種子は日本とラオスの両国が保有し、日本でも土壌伝染性病害虫への抵抗性を含む諸特性を調査する予定である。

Fig. 1. Main sites visited during the 2016 survey in northwestern Laos (●), plotted on a free map provided by the GMS Sustainable Tourism Development Project in Lao PDR.

Photo 1. Mountainous region in Nalae District

Photo 2. Car rented during the survey

Photo 3. Commercial eggplants grown from seeds imported from China or Thailand at a market in Ban Namchang

Photo 4. Survey of eggplants at a farmer's stall on the way to Luang Namtha

Photo 5. *Solanum torvum* growing in a garden in Ban Phon Saksayan (No. 5)

Photo 6. Interviewing local people in Ban Pou Phat

Photo 7. Interviewing local people in Ban Lank Khame

Photo 8. Discussion with the deputy director of the Horticultural Research Center

Photo 9. Drying of seeds extracted from the accessions collected during the survey

Photo 10. Reporting our preliminary results to staff of the Horticultural Research Center

Photo 11. Large Chinese-owned plantations of common bean on the way to Luang Namtha

Photo 12. Discussion with staff of the Province Agriculture and Forestry Office of Luang Namtha

Photo 13. Fruits of eggplant collected in Ban Phon Saksayan (No. 4)

Photo 14. Fruits of *Solanum torvum* collected in Ban Phon Saksayan (No. 5)

Photo 15. Fruits of *Solanum violaceum* collected in Ban Naleu (No. 10)

Photo 16. Fruits of eggplant collected in Ban Namtung (No. 12)

Photo 17. Fruits of eggplant collected in Ban Namtung (No. 13)

Photo 18. Fruits of eggplant collected in Ban Namtung (No. 18)

Photo 19. The District Agriculture and Forestry Office of Vieng Phoukha

Photo 20. Survey of eggplants in a field in Ban Vieng Savang

Photo 21. *Solanum violaceum* growing in a garden in Ban Vieng Savang (No. 21)

Photo 22. Fruits of *Solanum violaceum* collected in Ban Vieng Savang (No. 22)

Photo 23. Fruits of *Solanum aethiopicum* collected in Ban Vieng Savang (No. 23)

Photo 24. Fruits of eggplant collected in Ban Nam Par (No. 29)

Photo 25. Fruits of *Solanum violaceum* collected in Ban Nam Par (No. 28)

Photo 26. Fruits of eggplant collected in Ban Vieng Savang (No. 34)

Photo 27. Extracting and drying seeds from rotten fruits at a guesthouse

Photo 28. Fruits of *Solanum aethiopicum* collected in Ban Nang Bou (No. 41)

Photo 29. Immature fruits of eggplant collected in Ban Lank Khame (No. 50). Seeds were extracted from rotten fruit.

Photo 30. Border between Laos and China

Photo 31. Large Chinese-owned plantations of banana in Ban Nam da Mai, near the border with China, on the way to Luang Namtha

Photo 32. Fruits of *Solanum aethiopicum* collected in Ban Lak Khane Mai Kh (No. 54)

Photo 33. Fruits of eggplant collected in Ban Hat Na Leng (No. 58)

Photo 34. Fruits, flower, and leaves of eggplant collected in Ban Hat Na Leng (No. 62)

Photo 35. Eggplants smoked for preservation of seeds in Ban Pou Phat (Nos. 65–67)

Photo 36. Discussion with the deputy director of the Province Agriculture and Forestry Office of Bou Keo

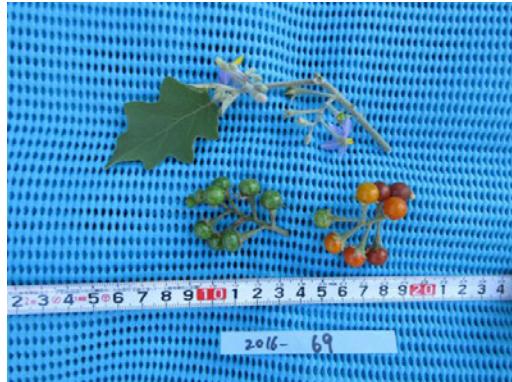

Photo 37. Fruits, flowers, and leaves of *Solanum violaceum* collected in Ban Noung Khon (No. 69)

Photo 38. Fruits of *Solanum aethiopicum* collected in Ban Noung Khon (No. 72)

Photo 39. Discussion with the director of the Province Agriculture and Forestry Office of Bou Keo

Photo 40. Donsao, on the borders with Myanmar and China

Photo 41. Fruits, flowers, and leaves of eggplant collected in Ban She Meunggen (No. 81)

Photo 42. Discussion with the director of the District Agriculture and Forestry Office of Meung District

Photo 43. District Agriculture and Forestry Office staff of Meung District

Photo 44. A fruit of eggplant collected in Ban Phoum Savang (No. 89)

Photo 45. Discussion with staff of the District Agriculture and Forestry Office of Pha Oudom District

Photo 46. Flower, leaves, immature fruit, and smoked fruits in Ban Pang Thoung (No. 101)

Photo 47. Farewell dinner with staff, including the deputy director, of the Horticultural Research Center in Vientiane

Photo 48. Many commercial vegetable seeds imported from China at a market in Ban Namchang
