Summary

Collaborative survey of plant genetic resources was performed in the southern part of Sayabouly Province, Lao People's Democratic Republic. Sorghum, maize, and beans were the main targets of the survey, which was conducted between February 16 and 19, 2019. Thirty accessions, including four *Sorghum bicolor*, 10 *Zea mays*, four *Vigna umbellata*, five *Vigna unguiculata*, one *Glycine max*, three *Arachis hypogaea*, and three *Erianthus procerus*, were collected. All 10 maize accessions were waxy (glutinous) type.

KEY WORDS: Sayabouly Province, *Sorghum*, *Erianthus*, maize, *Vigna*, soybean, peanut

Introduction

The National Institute of Agrobiological Sciences (NIAS) of Japan and the National Agriculture and Forestry Research Institute (NAFRI) of Laos established a Joint Research Agreement (JRA) in 2014. The NIAS and NAFRI planned a collaborative survey in Laos for plant genetic resources. All obligations and rights of the NIAS under the JRA have been transferred to the National Agriculture and Food Research

Organization (NARO), owing to a merger between NARO and NIAS in April 2016.

Since 2006, the NIAS and NAFRI have conducted collaborative surveys and collection expeditions in Laos for plant genetic resources under the Memorandum of Agreement and Memorandum of Understanding (Sakata *et al.* 2008; Saito *et al.* 2009; Matsunaga *et al.* 2010).

Surveys of cereal crop genetic resources have also been conducted in the provinces of Xieng Khouang, Houa Phan, Bolikhamsay, Khammouane, Oudomsay, Luang Namtha, Bokeo, Phongsaly, and Luang Prabang and in the country's capital city Vientiane (Kawase *et al.* 2012; Okuizumi *et al.* 2011, 2013, 2015a, 2015b, 2016; Yamamoto *et al.* 2015a, 2015b).

In the present survey, we visited the southern part of Sayabouly Province, which was not surveyed in the past; this survey was mainly targeted at collecting sorghum, maize, and beans, which are the most important crops in Laos. The survey included both Japanese and Laotian researchers.

Methods

The survey was conducted from February 16 to 19, 2019 (Table 1). We visited seven sites during the present survey (Fig. 1). A rental car was used for transportation between the sites. The survey group consisted of a NARO researcher, NAFRI researcher, and Laotian driver. Samples were obtained from villagers or the field. We recorded the location information by using GPS (foretrex301, Garmin Ltd., Zurich, Switzerland), as well as data (e.g., plant height, panicle length, and local name) and photos of the collected plant samples. The alphabet spelling of locations in this report was refer to the map (World mapping project 2014).

Results

We visited five villages in the southern part of Sayabouly Province and collected 30 accessions of four *Sorghum bicolor*, 10 *Zea mays*, four *Vigna umbellata*, five *V. unguiculata*, one *Glycine max*, three *Arachis hypogaea*, and three *Erianthus procerus* (Table 2). Detailed results for each day are shown below.

(1) February 16, 2019 (Vientiane-Paklay dist., Sayabouly Prov.)

The survey started in Vientiane toward the west. We drove along the Mekong River and across it. We visited Paklay District Agriculture and Forestry Office (DAFO; Fig. 1). We visited farmers in Pangkho village (Photo 1); Ms Nivanh (*Lao tribe*) provided us with a *S. bicolor* sample with collection number 2019-02-L1 (hereafter L1, Photo 2), a *V. unguiculata* sample (L2, Photos 3 and 4), and three *Z. mays* samples (L4-6, Photos 6-8). Ms Ban and Mr Thun (both *Lao*) also provided *V. umbellata* (L3, Photo 5) and *V. unguiculata* (L7, Photo 9) samples, respectively.

Table 1. Itinerary of the survey in Laos

Date	Day	Itinerary	Collection
16-Feb	Sat	Vientiane - Paklay Dist., Sayabouly Prov.	L1 - 7
17-Feb	Sun	Paklay Dist., Sayabouly Prov.	L8 - 17
18-Feb	Mon	Kenthao Dist., Sayabouly Prov.	L18 - 29
19-Feb	Tue	Xanakham Dist., Sayabouly Prov. - Vientiane	L30

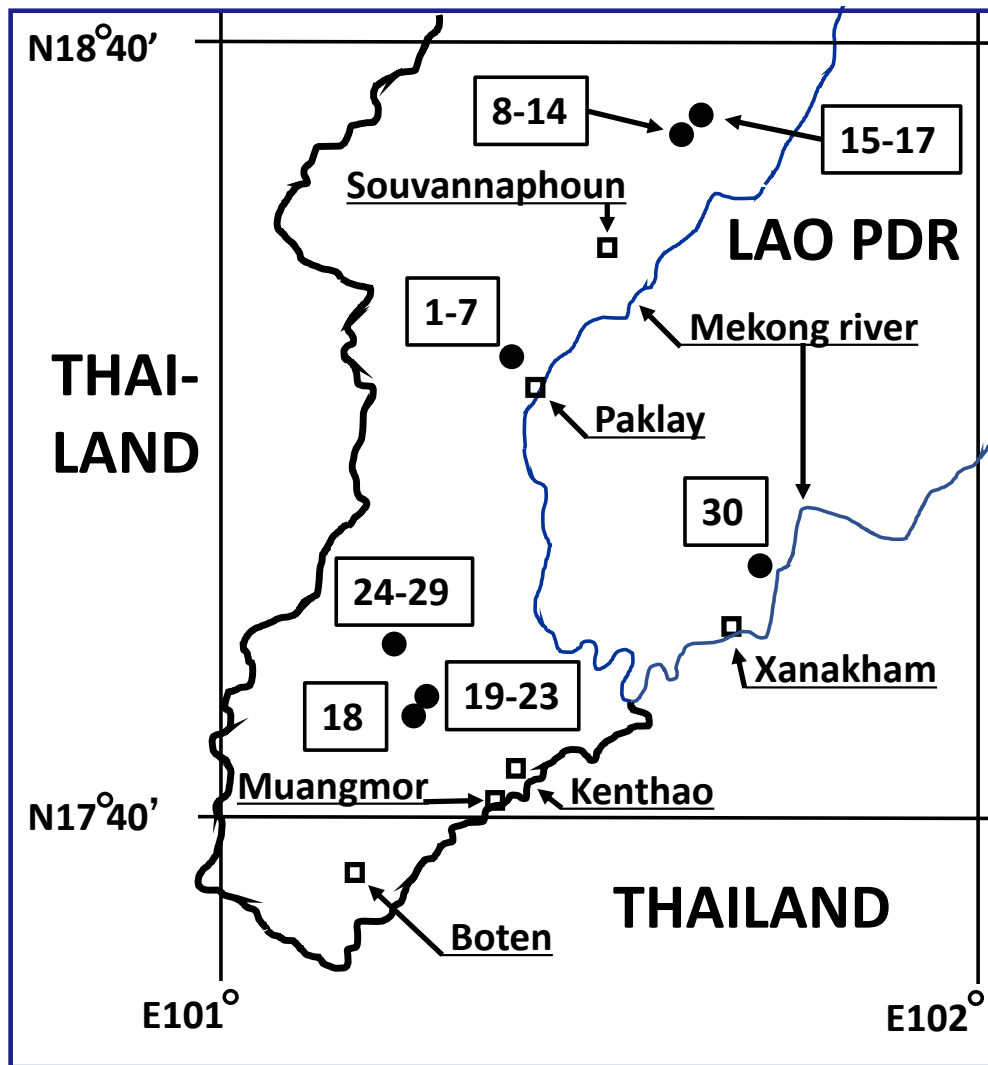

Fig. 1. Map of collection sites.

(2) February 17, 2019 (Paklay dist., Sayabouly Prov.)

The survey continued in Paklay district. In Muangpa village, Ms Sirao (*Hmong tribe*) provided us with three *Z. mays* samples (L8, L13, and L14; Photos 10, 16, and 17, respectively). Next, Ms Yerao (*Hmong*) provided *Z. mays* (L9, Photo 11) and *G. max* (L10, Photo 12) samples. An *S. bicolor* sample (L11, Photo 13) was provided by Ms Daivue (*Hmong*). An *E. procerus* sample (L12, Photos 14 and 15) was also obtained in the village.

In Nachan village, Ms Buachan (*Lao*) provided us three samples of *S. bicolor* (L15, Photo 18), *Z. mays* (L16, Photo 19), and *V. unguiculata* (L17, Photo 20).

(3) February 18, 2019 (Paklay dist., Sayabouly Prov.)

Along the way from Kenthao City to Houaykha village, we found an *E. procerus* sample (L18, Photos 21 and 22). In Houaykha village, Ms Khoun (*Lao*; Photo 25) provided us *Z. mays* (L19, Photo 23), *V. umbellata* (L20, Photo 24), and *A. hypogaea* (L21, Photo 26) samples. Mr Bualien (*Lao*) also provided *S. bicolor* (L22, Photo 27) and *Z. mays* (L23, Photo 28) samples.

We also visited Houayleuk village and met Ms Phou (*Lao*). She provided us two samples each of *V. unguiculata* (L24 and L25, Photos 30 and 31, respectively), *V. umbellata* (L27 and L28, Photos 33 and 34, respectively), and *A. hypogaea* (L26 and L29, Photos 32 and 35, respectively).

Table 2. Number of collected genetic resources and their names

Species Name	Number of collection	Lao's basic name	Hmong's basic name
<i>Sorghum bicolor</i>	4	Oilkhaofang, ອັອຍເຂົ້າຝາງ, ເຂົ້າຝາງ Khaofang	Oilkhaofang ອັອຍເຂົ້າຝາງ
<i>Zea Mays</i>	10	Saroy, Salynem, ສາວອຍ, ສາວິເນມ, ສາວິເນມ Khaophodkao, ເຂົ້າໂພດຂາວ, ສາວິເຫຼ້ Salylair	Saroy, ສາວອຍ, ສາວິເຂົ້າ Salykhaonyo, ຫຽວ, ສາວິດ່າ Salydum
<i>Vigna umbellata</i>	4	Thoadeng ຖົ່ວແດງ	- -
<i>Vigna unguiculata</i>	5	Thoasaiaon, ຖົ່ວໃສ່ອັນ, ຖົ່ວດ່າ, ຖົ່ວ Thoadum, ຕົງເສືອ Thoatingsua	- -
<i>Glycine max</i>	1	Thoalueng ຖົ່ວເຫຼືອງ	- -
<i>Arachis hypogaea</i>	3	Thoadin ຖົ່ວດິນ	- -
<i>Erianthus procerus</i>	3	Khemxang, ແຂມຊ້າງ, ດອກເລົາ, ນຸ້ນ Doklao, noun or ຫຼື ເລົາ rao	- -
Total	30		

(4) February 19, 2019 (Xanakham dist., Sayabouly Prov., Vientiane)

Along the way from Xanakham City to Vientiane, we found an *E. procerus* sample (L30, Photo 36).

Discussion

In the present survey, a total of 30 accessions of genetic resources were collected from farmers and on the roadsides (*E. procerus*), as discussed below.

(1) *Sorghum bicolor*

Three farmers (two *Lao* and one *Hmong tribe*) provided four accessions. They are called as “Oilkhaofang” or “Khaofangdeng.” The crop season is May/June to October/November. The ranges of plant height and panicle length were 2-4 m and 27-33 cm, respectively. They were all grown for tasting sweet juice.

(2) *Zea mays* (maize)

Ten accessions of *Z. mays* were collected from four *Lao* and two *Hmong* tribes. Lao people called *Z. mays* “Saroy” (or “Saroynoy”), “Saly,” (“Salylair” and “Salynem”) and “Khaophod.” The crop season is May/June to July/September. The ranges of plant height and ear length were 1-3 m and 6-15 cm, respectively. They were all grown for obtaining flesh ear/corn, and the grains were all waxy (glutinous) types.

(3) *Vigna umbellata* (rice bean)

Three farmers (*Lao tribe*) provided four accessions. All of them were called “Thoadeng.” The crop season is July/August to October/January. The range of pod length was 15-30 cm. The grain of all the accessions was edible, and two of them had edible immature grains (like edamame in Japan).

(4) *V. unguiculata* (cowpea or yard long bean)

Four farmers (*Lao*) provided five accessions. They called the four cowpeas as “Thoasaiaon” or “Thoatum,” and the yard long bean as “Thoatingsua.” The crop season of cowpea was May to October and of yard long bean was May to July. The range of pod length was 14-30 cm. The grain of all accessions were edible. Two cowpeas had edible immature grains (like edamame in Japan), and the flesh pods of the other two cowpeas and yard long bean were edible as a vegetable.

(5) *Glycine max* (soybean)

One accession was collected from a *Hmong* farmer and called “Thoalueng.” The crop season was August to November. The plant height was 60-80 cm, and pod length was 5 cm. It was grown for obtaining grain.

(6) *Arachis hypogaea* (peanut)

Two farmers (*Lao*) provided three accessions. All of them were called “Thoadin.” The crop season was May to September. The range of plant height was 30 - 50 cm, and pod length was 1 - 4.5 cm. All accessions were grown for obtaining grain and flesh pod as vegetable.

(7) *Erianthus procerus*

Three accessions were collected on the roadside. They were called “Khemxang,” “Doklao,” or “Noun or rao.” The range of plant height was 3.6-6.4 m, and panicle length was 0.8-1.2 m. The panicle has dense hair and was used to make pillows in two villages (Muangpa and Houaykha).

The detailed data of the 30 accessions mentioned above are shown in Table 3. Interestingly, all 10 maize accessions collected were waxy (glutinous) type. The glutinous varieties were chosen for maize in this region, as glutinous rice was preferred in Laos.

Conventional plant genetic resources were rapidly lost because of the shifting of large-scale cultivation of cash crops such as cassava (Photo 29). The survey and conservation of plant genetic resources other than cash crops need to be conducted at the earliest. The characteristics of plant genetic resources obtained in the present survey will be studied in Laos and Japan.

Acknowledgment

We thank Dr Bounthong Bouahom, former Director General; Dr Chay Bounphanousay, present Director General of NAFRI; and Dr Chanthakhone Boualaphanh, Director of the Rice Research Center (RRC), NAFRI, for supporting the survey. This work was supported by a grant (Genebank Project) of Japan.

和文摘要

本研究報告は、ジーンバンク事業の一環として、2019年2月16日から19日にかけて行われたラオス(サニャブリ県)における海外植物遺伝資源の探索・収集に関するものである。本探索では、ラオスのサニャブリ県南部の村で、ソルガム、トウモロコシ、マメを主な対象作物とする探索を行った。その結果、ソルガム4点、トウモロコシ10点、ツルアズキ4点、ササゲ5点、ダイズ1点、ラッカセイ3点、エリアンサス3点、合計30点の植物遺伝資源を収集し、ラオスジーンバンクに保存した。
