Summary

We surveyed the prefectures of Toyama, Ishikawa, Fukui, Gifu, Aichi, and Mie in Japan for wild relatives of leguminous crops from the 19th to 23th of October, 2015. From 43 collection sites, we collected 51 accessions, including comprising 30 *Vigna angularis* var. *nipponensis* accessions and 21 *Glycine soja* accessions. We found *V. angularis* var. *nipponensis* in the prefectures of Toyama, Ishikawa, Fukui, and Gifu but not Mie and Aichi; and *G. soja* was found in all six prefectures. We registered all the collected accessions in the NARO Genebank. We will multiply the seeds of the collected accessions and evaluate their growth traits in 2016 at our experimental field in the city of Tsukuba. The multiplied seeds will become available upon request for research, breeding and educational purposes.

KEYWORDS: wild legumes, *Vigna*, *Glycine*, genetic resources

Introduction

The NARO Genebank project has been conducting field surveys for the collection and conservation of *Vigna* and *Glycine* germplasm distributed throughout Japan (Vaughan *et al.*, 2010; Tomooka *et al.*, 2010; see also Annual Report on Exploration and Introduction of Plant Genetic Resources, https://www.gene.affrc.go.jp/publications.php#plant_report). The genera *Vigna* and *Glycine* belong to the legume family (Leguminosae) and include a variety of crops, including azuki bean (*Vigna angularis* (Willd.) Ohwi & H.Ohashi, Japanese name: azuki), and soybean (*Glycine max* (L.) Merr., Japanese name: daizu).

We have recently focused on collecting wild and naturally growing accessions of these species because such accessions are likely adapted to the environmental conditions of their corresponding habitats and, thus, may possess tolerance to corresponding biotic and abiotic stresses (McCouch *et al.*, 2013). Wild

azuki bean (*V. angularis* var. *nipponensis* (Ohwi) Ohwi & H.Ohashi) and wild soybean (*G. soja* Siebold & Zucc.) are regarded as the wild ancestors of azuki bean and soybean, respectively. In Japanese language, wild azuki bean is called as yabutsuruazuki, and wild soybean is called as tsurumame.

In the present survey, we explored central region of the main island of Japanese because only a few accessions had been previously collected from this region. We surveyed the prefectures of Toyama, Ishikawa, Fukui, Gifu, Mie, and Aichi from 19th to 23th October, 2015.

Methods

Table 1 shows the schedule of this field survey. On the first of the survey, we started in the city of Toyama, drove east to Nakashinkawa county, turned west, and drove through the city of Himi to the city of Nanao. On the second day, we drove around Noto Peninsula, from the city of Tamasu to Wajima City. On the third day, we started in Kanazawa City and drove down to the city of Echizen. On the fourth and fifth days, we surveyed the Nobi plain in the prefectures of Gifu, Mie, and Aichi (Fig. 1).

Prior to the field survey, we had selected survey sites using Google Earth. The selected sites were located on riverbanks, edges of canals, and borders between paddy fields and shrines or dwellings. For the collection sites, we recorded the corresponding addresses, altitudes, latitudes, longitudes; sketched the surrounding habitat; and noted other ecological information as passport data. The GPS data was measured using handheld GPS device (GPSMAP 62SC; Garmin), and when *V. angularis* var. *nipponensis* or *G. soja* population were located, we collected bulked seed samples.

Results and Discussion

We found either of *V. angularis* var. *nipponensis* or *G. soja* at 36 of the 43 survey site (Table 2, Fig. 1) and neither at seven sites, of which six and one were located in the prefectures of Gifu and Mie, respectively. We collected 30 accessions of *V. angularis* var. *nipponensis*, mostly from the prefectures of Toyama, Ishikawa, and Fukui, and 21 accessions of *G. soja*, which was found in all six of the surveyed prefectures (Table 3). The passport data are summarized in Table 4. Photos of the collection sites and collected seeds are shown in Photos 1-55 and Seed Photos 1-51, respectively. We found both *V. angularis* var. *nipponensis* and *G. soja* at six sites, (Toyama 2, Noto 5, Ishikawa 5, Fukui 3, Fukui 4, and Gifu 6), and the two species formed sympatric populations at Toyama 2, Ishikawa 5, and Gifu 6 but not at Noto 5, Fukui 3, and Fukui 4.

Table 1. Itinerary of the field exploration in Hokuriku and Tokai (Toyama, Ishikawa, Shiga, Gifu, Aichi, and Mie)

Date	Itinerary	Stay
2015/10/19	NARO (Ibaraki) → (railway) → Toyama (Toyama) → (Rent a Car) → Yao → Nakashinkawa → Himi → Nanao (Ishikawa)	Nanao (Ishikawa)
2015/10/20	Nanao (Ishikawa) → Noto Island → Housu → Suzu → Wajima (Ishikawa)	Kanazawa (Ishikawa)
2015/10/21	Kanazawa (Ishikawa) → Hakusan → Nomi → Komatsu → Kaga → Awara → Sakai (Fukui) → Fukui → Sabae → Echizen (Fukui)	Nagahama (Shiga)

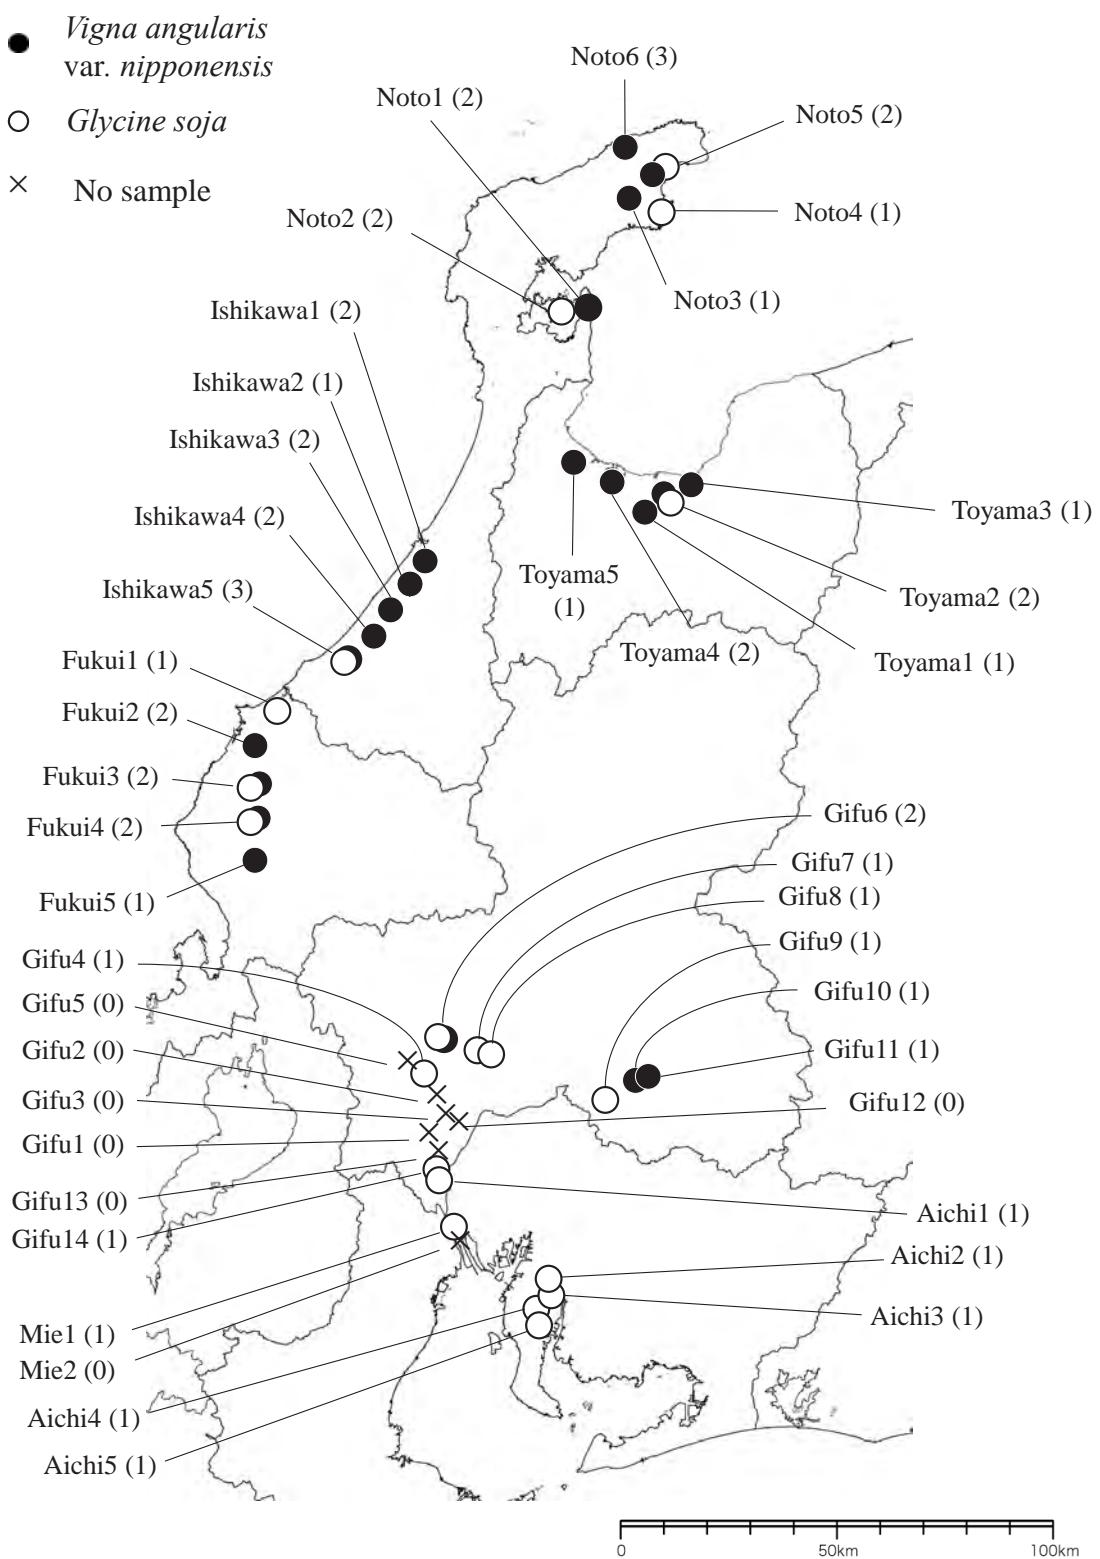

Fig.1. A map of collection sites. The numbers in parentheses indicate numbers of collected samples

The collected accessions will be evaluated for their growth traits and be multiplied in 2016 at our experimental field in Tsukuba City. The multiplied seeds will become available upon request for research, breeding, and educational purposes.

Table 2. A summary of collection sites

No. of sites	Toyama	Ishikawa	Fukui	Gifu	Aichi	Mie	Total
Collected	5	12	5	8	5	1	36
<i>Vigna angularis</i> var. <i>nipponensis</i> *	5	9	4	3	0	0	21
<i>Glycine soja</i> **	1	5	3	6	5	1	21
Not collected	0	0	0	6	0	1	7
Total	5	12	5	14	5	2	43

*. ** The number of sites were double counted if the two species found in same site

Table 3. A summary of collected samples in each prefecture

Species	Toyama	Ishikawa	Fukui	Gifu	Aichi	Mie	Total
<i>Vigna angularis</i> var. <i>nipponensis</i>	6	16	5	3	0	0	30
<i>Glycine soja</i>	1	5	3	6	5	1	21
Total	7	21	8	9	5	1	51

Vigna angularis* var. *nipponensis

We collected 30 accessions of *V. angularis* var. *nipponensis*. In Ishikawa 4, we found one population, but the seeds were immature and, thus, not collected. Of the 30 accessions, we suspected that 10 represented weedy forms (i.e., forms intermediate between domesticated and wild forms; Table 4). Of these 10 accessions, Noto 6-2, Ishikawa 1-2, Ishikawa 3-1, Ishikawa 4-2, Ishikawa 4-3, and Ishikawa 5-2 exhibited light brown seed coats, a phenotype that is typical of weedy forms (Seed photos 17, 20, 22, 24, 25, and 27; Tomooka et al., 2011). We also suspected that Noto 3-1 (Seed photo 12), Noto 6-3 (Seed photo 18), and Ishikawa 3-2 (Seed photo 23) were weedy because they exhibited intermediate phenotypes in regards to seed size, branching, twining, and pod shattering. Accession Ishikawa 4-1 also exhibited weedy phenotypes; however, seeds were not collected. We also noted that the accession obtained from Gifu 11 lived at the bottom of a shallow stream (Photo 47), which was the wettest habitat encountered during this survey.

Since *V. angularis* var. *nipponensis* often lives along the edges of paddy fields, fallows, canals, and riverbanks, we surveyed such locations and easily identified populations in the prefectures of Toyama, Ishikawa, and Fukui. In these areas we found accessions at 18 of 22 survey sites. An example of a population found in a fallow was the population identified at Toyama 1, where we found a 10 m x 10 m population (Photos 1-3) that was growing in wet soil with grasses. In addition, the *V. angularis* var. *nipponensis* plants at this site were associated with *Persicaria longiseta* (Creeping smartweed, inutade) and *Youngia japonica* (Oriental false hawksbeard, onitabirako). Meanwhile, a typical canal-edge population was identified at Ishikawa 1, where we found a 3 m x 100 m population growing in a riverbank (Photos 20 and 21). In this survey site the plants of *V. angularis* var. *nipponensis* were associated with *Misanthus sinensis* Andersson (Japanese silver grass, susuki) and *Equisetum arvense* L. (Field Horsetail, sugina). Fukui 3 was a typical riverbank habitat. At this survey site, we found a 10 m x 10 m population growing along the bank of Hino River (Photo 33 and 34), and the plants were associated with *Solidago canadensis* var. *scabra* L. (Canada goldenrod, seitaka awadachisou). Therefore, we concluded that *V. angularis* var. *nipponensis* thrived in these three prefectures (Toyama, Ishikawa, and Fukui).

In the prefectures of Gifu, Mie, and Aichi, however, it was difficult to locate populations, and we were only able to identify *V. angularis* var. *nipponensis* at three of the 14 survey sites, all of which were

located in Gifu prefecture.

Before this survey, we had conserved few *V. angularis* var. *nipponensis* accessions from the prefectures of Toyama, Ishikawa, Fukui, Gifu, Mie, or Aichi in NARO Genebank. The present survey allowed us to obtain accessions from Toyama, Ishikawa, Fukui, and Gifu, but not Mie or Aichi. Therefore, we should resurvey the prefectures of Mie and Aichi, probably in areas with higher altitude, such as mountain villages, which are also thought to serve as habitats for the species (Tomooka *et al.*, 2015).

Glycine soja

Compared to other regions in Japan, the central region of the main island of Japan is poorly represented in regards to *G. soja* in NARO Genebank. During the present survey, we collected and added accessions from six prefectures. The habitat of *G. soja* is similar to *V. angularis* var. *nipponensis*. However, *V. angularis* var. *nipponensis* was typically found beside streams or canals, whereas *G. soja* was also found in drier habitat, such as Noto 2-1 (Photo 12), which *G. soja* was found growing near an unpaved parking lot. The distribution of *G. soja* also seemed to differ among the prefectures, and the trend was opposite that observed for *V. angularis* var. *nipponensis*. For example, In Toyama prefecture, we only identified a single *G. soja* accession, and in the prefectures of Mie and Aichi, we identified *G. soja* at six of the seven survey site.

和文摘要

本報告は2015年10月19日から23日にかけて実施した富山・石川・福井・岐阜・愛知および三重の6県におけるマメ科作物近縁野生種の探索についての報告である。本調査において43箇所の収集地点を探索し、30系統のヤブツルアズキ (*V. angularis* var. *nipponensis*) と21系統のツルマメ (*G. soja*) を収集した。ツルマメは6県全てで収集できたのに対し、ヤブツルアズキの大部分は富山・石川・福井の3県で収集され、岐阜では3点のみ、三重・愛知での探索地点においては全く発見できなかった。これら収集系統は全て農研機構遺伝資源センター（つくば市）にて栽培し、特性評価および種子増殖を行う予定である。増殖した種子は配布可能な遺伝資源として農研機構ジーンバンクで保存する。
