Summary

We have conducted a field survey for collecting *Glycine* and *Vigna* genetic resources in Nagasaki and Kumamoto prefectures, Japan, from 20th to 24th October, 2014. A total of 91 accessions, consist of 51 wild soybean (*Glycine soja* Sieb. & Zucc., Japanese name : tsurumame), 3 naturally growing intermediate azuki bean (*Vigna angularis* (Willd.) Ohwi & H. Ohashi, zassou azuki), 21 wild azuki bean (*Vigna angularis* (Willd.) Ohwi & H. Ohashi var. *nipponensis* (Ohwi) Ohwi & H. Ohashi, yabutsuru azuki), 6 *Vigna nakashimae* (Ohwi) Ohwi & H. Ohashi (himetsuru azuki), 6 *Vigna radiata* (L.) Wilczek (ryokutou), 2 *Vigna umbellata* (Thunb.) Ohwi & H. Ohashi (tsuru azuki) and 2 *Vigna unguiculata* (L.) Walp. (sasage), was collected. The collected seeds were conserved in the National Institute of Agrobiological Sciences (NIAS) genebank. We plan to multiply the seeds and to evaluate their growth traits in 2015. The multiplied seeds will become available upon request from NIAS genebank for research and educational purposes.

KEY WORDS : *Glycine*, *Vigna*, genetic resources, Japan

Introduction

The genus *Glycine* and *Vigna* belong to the legume family (Leguminosae), and include crops such as soybean (*Glycine max* (L.) Merr., Japanese name: daizu), cowpea (*Vigna unguiculata* (L.) Walp., sasage), mungbean (*Vigna radiata* (L.) Wilczek, ryokutou), rice bean (*Vigna umbellata* (Thunb.) Ohwi & H. Ohashi, tsuru azuki), and azuki bean (*Vigna angularis* (Willd.) Ohwi & H. Ohashi, azuki). The NIAS genebank has been conducting collecting trips for the conservation of *Glycine* and *Vigna* germplasm distributed in Japan (Vaughan *et al.*, 2010, Tomooka *et al.*, 2010, see also Annual Report on Exploration and Introduction of Plant Genetic Resources, NIAS, https://www.gene.affrc.go.jp/publications.php#plant_report). We are recently focusing mainly on the collection of wild species and naturally growing genetic resources probably escaped from old cultivation. Wild species and naturally growing plants might have favorable characters for breeding biotic and abiotic stress tolerant crops. This is a report of the field survey for collecting *Glycine* and *Vigna*

genetic resources plants in Nagasaki and Kumamoto prefectures in Kyushu District, Japan.

Methods

A field survey was conducted by car in Nagasaki and Kumamoto prefectures, Japan from 20th to 24th October, 2014 (Table 1). When we saw naturally growing *Glycine* or *Vigna* plants from the car or saw the environment where these legumes seemed to grow, we stopped our car and searched the area in order to collect seeds from natural populations. Bulk seeds were collected from naturally growing plants. If a population contained plants with different traits, the seeds were separated according to these traits. Naturally growing plants (not cultivated by farmers) were classified visually either as wild form or intermediate form. Wild form shows typical wild characteristics, such as mottled black small seeds, shattering pods and twining slender stems. Intermediate form shows some of the characteristics of the domesticated form, generally having light-colored larger seeds, weak-shattering pods and non or less twining stems. As a passport data, the collection site name, latitude, longitude, altitude, sketch map of the collection sites and special characteristics of the habitats and plants we noticed were recorded. The latitude and longitude were measured by WGS84 world geodetic system using Garmin GPSmap 60CSx.

Table 1. Itinerary of Exploration in Nagasaki and Kumamoto prefectures (Oct. 20 - 24, 2014)

Date	Itinerary	Stay
10/20	NIAS (Ibaraki) → (railway) → Haneda airport (air) Fukuoka airport → (rent a car) → Hirado (Nagasaki)	Hirado (Nagasaki)
10/21	Hirado (Nagasaki) → Hirado island → Ikitsuki island → Hirado island → Sasebo → Isahaya → Obama (Nagasaki)	Obama (Nagasaki)
10/22	Obama (Nagasaki) → Unzen Mt. → Taira → Shimabara → Minamishimabara → Kuchinotsu → (ferry boat) → Oniike (Kumamoto) → Shimoda (Kumamoto)	Shimoda (Kumamoto)
10/23	Shimoda (Kumamoto) → Tomioka → Kawaura → Ushibuka → Gesushima → Ushibuka → Amakusa → Kamiamakusa → Yumigahama (Kumamoto)	Yumigahama (Kumamoto)
10/24	Yumigahama (kumamoto) → Kumamoto Airport (air) Haneda airport → NIAS (Ibaraki)	

Results and Discussions

A total of 91 accessions, consist of 51 wild soybean (*Glycine soja* Sieb. & Zucc., tsuru mame), 3 naturally growing intermediate azuki bean (*Vigna angularis*), 21 wild azuki bean (*Vigna angularis* (Willd.) Ohwi & H. Ohashi var. *nipponensis* (Ohwi) Ohwi & H. Ohashi, yabutsuru azuki), 6 wild *Vigna nakashimae* (Ohwi) Ohwi & H.Ohashi (himetsuru azuki), 6 naturally growing mungbean (*Vigna radiata*), 2 naturally growing rice bean (*Vigna umbellata*) and 2 naturally growing cowpea (*Vigna unguiculata*), was collected (Table 2). Passport informations of collected accessions are summarized in Table 3. Location of the collection site of each accession is shown in Fig. 1. Collected areas could be divided into 3 areas, i.e., Hirado area (consisting of Hirado island and Ikitsuki island, northern Nagasaki prefecture), Shimabara area (southern Nagasaki prefecture) and Amakusa area (western Kumamoto prefecture). Photos of the habitat were shown in Appendix 1 (Exploration Photos) and seeds of collected accessions were shown in Appendix 2 (Seeds Photos).

Total	0	13	78	91

In Hirado area, we have conducted a field survey mainly on Ikitsuki island and western side of Hirado island (Fig. 1). Eastern side of Hirado island was surveyed in 2013 (Takahashi *et al.*, 2014). In this area, we could collect a total of 30 accessions, consist of 11 wild soybean, 11 wild azuki bean, 2 naturally growing intermediate azuki bean, 5 wild *V. nakashimae*, and 1 naturally growing rice bean (Appendix 1, Photos 1 ~13, Appendix 2, NK-1 ~NK-29). Plenty of wild soybean and wild azuki bean populations were distributed in this area. At the northern tip of Ikitsuki island, we could collect both wild soybean (Photo 10, NK-18, NK-20) and wild *V. nakashimae* (Photo 10, NK-17, NK-19). Since the habitat was so windy that no trees could grow and the grassland changed leaves color to brownish probably because of the salty wind from the sea (Photo 11). Therefore, these accessions are expected to have salinity tolerance. *V. nakashimae* is cross compatible with both cultivated azuki bean and rice bean and therefore can be used for their breeding program (Tomooka *et al.*, 2002). In Nishihama of the Hirado island, a naturally growing rice bean plants were found in a home garden (Photo 13). The seed color was red (Appendix 2, NK-28) and considered to be a population escaped from cultivation. Probable escaped populations of rice bean were also found on Iki island and eastern side of Hirado island (Takahashi *et al.*, 2014).

In Shimabara area of Nagasaki prefecture, only 7 accessions consisting of 5 wild soybean and 2 naturally growing *V. radiata* accessions could be collected. Although we tried our best to find wild azuki bean population, we could not find any wild azuki bean population. This might be related to the soil type in this area. The soil in this area is volcanic ash derived soil from the Unzen mountain. The Unzen mountain erupted in 1991. Two accessions of naturally growing mungbean (NK-31, NK-33) had long crawling stem and easy shattering pods. The seed color was dirty greenish brown, indicating they are not directly escaped from modern mungbean variety having green seed color.

In Amakusa area, 54 accessions consisting of 35 wild soybean, 10 wild azuki bean, 1 naturally growing azuki bean, 1 wild *V. nakashimae*, 4 naturally growing mungbean, 1 naturally growing rice bean, 2 naturally growing cowpea accessions were found. Although we could find both wild soybean and wild azuki bean, wild soybean was more abundantly distributed. Four accession of naturally growing mungbean were found from Amakusa island, indicating the cultivation of mungbean was common in Amakusa area (NK53, NKB-2, NKB-7, NKB-15, Fig. 1). However, since the colors of seeds were dirty greenish brown or black mottled brown and seed size was small, it was considered that these accessions were not directly escaped from modern mungbean cultivar having green seed color. Two naturally growing cowpea accessions were found. One accession had black seeds (NK-49) and the other accession had creamy white seeds (NKB-13). Probable

escaped populations of cowpea were also found from Goto islands of Nagasaki prefecture (Tomooka *et al.*, 2013). Several plants of *V. nakashimae* were found growing at the edge of a paddy field (NK-62). As far as we know, this is the first site record of this species from Kumamoto prefecture.

長崎県および熊本県におけるダイズ属およびササゲ属マメ科植物遺伝資源の探索収集，2014年10月20日～24日

友岡 憲彦・井関 洋太郎・内藤 健・秋葉 光孝・飯泉 敏勝

農業生物資源研究所

摘要

本報告は、これまで保存点数が少なかった長崎県平戸地域、島原地域および熊本県天草地域におけるダイズ属およびササゲ属植物遺伝資源の調査報告である。調査は2014年10月20-24日にかけて行った。その結果、野生ダイズ (*Glycine soja*, ツルマメ) 51点、アズキ自生集団（雑草アズキ）3点、野生アズキ (*Vigna angularis* var. *nippensis*, ヤブツルアズキ) 21点、ヒメツルアズキ (*Vigna nakashimae*) 6点、リヨクトウ自生集団 (*Vigna radiata*) 6点、ツルアズキ自生集団 (*Vigna umbellata*) 2点、ササゲ自生集団 (*Vigna unguiculata*) 2点、合計91点のマメ科植物遺伝資源を収集した。ヒメツルアズキは、環境省レッドデータ絶滅危惧IB類に分類されている種で、作物であるアズキやツルアズキと交雑可能である。ヒメツルアズキが熊本県に分布していることは、今回の調査で初めて明らかになった。これらの遺伝資源は、つくば市にある農業生物資源研究所で栽培し、特性評価と種子増殖を行う計画である。増殖種子は、農業生物資源研究所のジーンバンクで保存するとともに、研究や教育目的で利用するために配布可能な遺伝資源とする。
