### Summary

We made a field study and collection of sesame (*Sesamum indicum* L.) in India from September 23 to October 18, 1992. India is thought to be one of the most important places for the genetic diversity of *S. indicum*. The itinerary and the trip route are shown in Table 1 and Fig. 1, respectively. We collected a total of 185 seed samples, of which 163 were those of *S. indicum* and its relatives (Table 2). The collection trip was started from South India to North India. Morphological variation of *S. indicum* was rather small in the Deccan Plateau of South India so far as observed. The so-called tropical type, which was characterized by tri-lobed leaves on the lower nodes, a single capsule per leaf axis, two carpels per capsule and branching habit on higher nodes, was commonly grown there. Plants with uni-lobed leaves or those having four carpels per capsule were rarely found admixed in the fields. The seed color varied as black, dark brown, brownish white and white. Local farmers in some villages near Raichur, Karnataka informed us that they grew two distinct types of black seeded sesame : a

usual type and a bitter type. They used the bitter sesame for a medicinal purpose as well as for oil extraction. In North India, *S. indicum* plants having different morphological characteristics were usually found mixed even in a small field. We observed alternately or oppositely fruited plants having one or three capsules per axis, and those of branching or non-branching types. A few plants which had semi-wild or weedy traits were also collected in a village near Jhansi, Uttar Pradesh. They had small fruits and the upper carpel of each fruit was easily dehiscing. It became clear through the interviews to the local farmers that *S. indicum* was widely used as a material for various food preparations rather than an oil source. For example, it is cooked for sweets, stuffing, topping, seasoning and so on. As an oil crop, sesame has been replaced by sunflower and soybean, since its productivity is lower. Local cultivars of this crop are, however, still grown often on a small scale, because of its importance in the traditional food habit in India.

**KEY WORDS** : sesame, *Sesamum indicum* L., germplasm collection, India

### 1. 目的および調査地選定理由

ゴマ油は食用油のなかで最も抗酸化性が強く、高い品質評価を受けている。またゴマに含まれる抗酸化性等物質は、油の品質保持に寄与するだけでなく、摂取した場合、生体内において過酸化反応抑制<sup>1), 2)</sup>、変異原性抑制<sup>3)</sup>等の機能性を有することも認められてきている。このように優れた特性を持つ作物でありながら、ゴマの生産地はアジア、アフリカの発展途上国が多く、古い作物であるにもかかわらず品種開発が遅れている。また、国際研究機関においてもゴマの遺伝資源の保存リストは作られておらず、わが国のゴマ遺伝資源の保有は著しく少ない。国際的にも、またわが国にとってもゴマ遺伝資源の収集保存は重要かつ緊急の課題である。

ゴマの起源地にはアフリカ説とインド説がある。インドには8種の野生種が確認されており<sup>4)</sup>、作付面積が220万ヘクタール（1989年FAO統計）に及ぶ世界最大のゴマ生産国である。ゴマ遺伝資源の調査収集の対象地域としては大いに期待される地域である。

### 2. 経過

インドの植物遺伝資源の代表機関であるNBPGR（国立植物遺伝資源事務局）と共同で調査・探索を実施した。事前の協議で、今回は栽培種 (*Sesamum indicum* L.) を収集することとした。その期間は9月23日から10月18日までの26日間で、日程および行程の概略図をそれぞれTable 1, Fig. 1に示した。

### 3. 収集・調査方法

#### 1) 調査収集地域の概況

デリーでの NBPGR との打ち合わせのなかで、①インドからの植物移出の際の検疫に最低5日を要するので帰国の5日前にはデリーに戻らなければならないこと、②本年はゴマの成熟が例年より早いことなどの事情や状況説明を受け、南から調査収集することとし、インド国内航空でデリーからポンベイ市の南東約100kmのプナ市に直行した。プナ市で車（小型のバン）を借り上げ、9月27日から10月12日にデリーに戻る間、連日車で移動し、収集活動を行った。この間の車での移動距離は合計5,100kmであった。

前半の調査ではプナ市を起点にマハラシュトラ州、カルナタカ州北部を中心とするいわゆるデカン高原の北部地域を一周した。この地域は標高400~800mの台地で森林がほとんどなく、点在する禿げた低い岩山に象徴される乾燥した地域である。主な夏作物は綿花、ソルガム、ササゲ、リヨクトウ、ヒマワリ、ラッカセイ、雑穀等で、乾燥が進んだところではトウジンビエ、キマメ、ゴマ等が栽培され、間混作が多い。水系は複雑でわかりにくいが、トウガラシやニンニク、タマネギが栽培される地帯（ダルワール近く）や水稻、サトウキビの栽培も一部で見られる。

後半の調査はプナ市より北上し、マハラシュトラ州、マディヤ・プラデシュ州の西部、ウッタル・プラデシュの一部、ラジャスタンのごく一部、ハリアナ州の一部を抜け、デリーに至る地域である。南北1,000kmにおよび、地形的にも、気象的にも多様であった。基本的に乾燥の程度、水利によって農業が特徴づけられているのは南部と同じであるが、インドールからサガールを過ぎる約400kmは近年に導入された大豆が主作物となって延々と続き、サガールからジャンスイに向かう途中には野生稻やジュズダマの成育地もみられた。このような地帯は山に木が多いことから降水量が多い地域と推察された。

#### 2) 収集の方法

車中で見つけたゴマ畑や、農夫に聞いて案内してもらったゴマ畑で形態的な特徴を調査しながら朔果または種子を収集した。

立毛状態の植物体を主な対象とし、抗酸化性等の有用成分の探索を目的としているので、外見は同じでも畑全体から多くの個体を収集するようにした。明らかに遺伝的形質（1節当たりの朔果数、1朔果当たりの心皮数）の異なる個体は分別収集した。朔果の形、茎の毛の濃密等で異なると思われる個体もあったが、識別性が絶対的でない形質については分別せずに混合収集した。

すでに収穫を終えて乾燥中のもの、農家の貯蔵種子、あるいは市場（バザール）で売られている種子なども一部入手した。

乾燥している地域はゴマの畑が多いので国道からゴマ畑を散見することができ、そのような地帯では、収集地点は一定の距離をおいて収集した。特異な個体を見いだした時は、その特異性が付近の畑で普遍的に見られるものであるか否かの確認等も行った。水稻、サトウキビ、ヒマワリ、ダイズの栽培地帯では国道からゴマ畑を見つけることは困難であった。そのよう

な所では、集落で道端の人に情報を聞くことにより、わずかに栽培が残っているゴマ畑にたどり着くことができた。このようにして時間はかかるがゴマの栽培密度の低いところでも収集することができた。

#### 4. 調査・収集の成果

##### 1) 収集の結果

本探索の結果、ゴマ163点、その他作物22点を収集した（Table 2）。163点のゴマの内、160点は栽培型で、そのほとんどは収集した地方の在来種と考えられる。また、ゴマと外見的にほとんど区別出来ないが、成熟が早く、裂開し易い小型の朔果をつける雑草的なゴマを2点収集した（種は未同定であるが、*Sesamum indicum* の原始的な型と思われる）。この雑草的なゴマは、栽培型のゴマ畑の中に見いだされた。その特徴は、成熟するとともに各朔果の二つの心皮のうちの一つが裂開し、種子を自然に分散させている点にある。すなわち、葉腋より斜め上方に突きだした朔果の茎側（上面側）の心皮は裂開しており、圃場で見たときには種子がほとんど残っていなかったが、外側（下面側）の心皮には種子が残っており、栽培型のゴマとともに収穫されている。種子は黒色で表面がざらついており、縁が角張っている。花色は、紫色と白色の両者が見いだされた。残る1点は栽培ゴマとは明らかに異なる野生種で、種は未同定である。ゴマ以外の収集品は、アワ（*Setaria italica*）7点、インドビエ（*Echinochloa frumentacea*）2点、センニンコク（*Amaranthus hypochondriacus*）1点、ソルガム（*Sorghum bicolor*）1点、トウジンビエ（*Pennisetum americanum*）1点などの雑穀、ケツルアズキ（*Vigna mungo*）2点、リヨクトウ（*Vigna radiata*）1点、モスピーン（*Vigna aconitifolia*）1点、ササゲ（*Vigna unguiculata*）1点のマメ類、それ以外にパン・コムギ（*Triticum aestivum*）、ドゥラム・コムギ（*Triticum durum*）、エンマー・コムギ（カブリ・タイプ）（*Triticum dicoccum*）、ヒマワリ（*Helianthus annuus*）、オクラ近縁（*Abelmoschus tuberculatus*）各1点であった。

##### 2) 収集地域におけるゴマ遺伝資源の特徴

今回の調査地域を便宜的に南部と北部にわける。

南部、すなわちデカン高原ではゴマの形態的な変異はあまりなく、いわゆる熱帯型が普通に見られた。熱帯型の特徴は、葉腋当たり1朔果（1朔型）、1朔果当たり2心皮で、茎の上部で分枝し、下位の葉は3裂という特徴を持つ。ごくまれに1朔果当たり4または3心皮、あるいは全縁の葉を持つ個体が畑の中に混在しているのが見いだされた。小林<sup>4)</sup>はゴマの原始的な形態はこの熱帯型で、野生種が多数存在するアフリカにおいても熱帯型のゴマにはあまり大きな形態的変異がみられないと述べているが、インドのデカン高原においても形態は单调であった。これらの地域では白色、黒色あるいは焦げ茶色の種皮色の在来種が栽培されている。

ところが、カルナタカ州北東部の村で、農夫から黒色の品種には2種類あるという情報を得た。ひとつは普通の味、他のひとつは苦いという。苦い品種はその油を食用だけでなく薬用にも利用するという。今回、この苦いという種子を入手することができたので、その特性

解明に関心が持たれる。苦いゴマの情報は特定の成分など生化学的な面では多様性を含んでいる可能性を示唆するものである。

北部に進むにつれさまざまな形態的特徴の個体が混在している畑が見られるようになった。すなわち葉腋当たり1朔果から3朔果(3朔型)，茎の朔果の着生は互生的あるいは対生的，茎は無分枝あるいは茎の中・下部からの分枝等である。小林<sup>4)</sup>によると3朔型は1朔型の朔果の付け根の両側にある花外密腺が朔果に進化したものであり，また，対生型は互生型の進化したものである。調査地域では1朔果当たりの心皮数は2心皮が主流で4心皮はまれであった。また，種皮色は白色が一般的であった。北上するにつれ3朔型の混入は多くなったが，全個体が3朔型のような改良品種を栽培している畑は見あたらなかった。

南部ではまれにみられる3朔型をなぜ選抜しないのか不思議であったが，北部で多くの農家を訪問するなかで，3朔型，あるいは対生的に朔果をつける個体を意識的に選抜しているいくつかの農家に会った。また，すでに収穫したところで，3朔型と1朔型とを分けて乾燥しているところがあったので，なぜ両型を栽培するのか疑問に思い，1朔型のメリットは何か聞いたところ，今後，3朔型に替えたいとのことであった。このようなところでは年を経るにつれ在来種が変遷してゆくものと思われる。

ゴマの生育状況をみると，南部(デカン高原北部)のゴマの生育は不良であった。石礫が多い条件の悪い畑にゴマが栽培され，乾燥に強いといわれるゴマでも萎凋しているような状況であった。熱帯型ゴマはわが国では2m以上に伸長し上位で分枝するためほとんど倒伏する。インドでも湿潤と思われるところでは2.3m位まで伸長しており，熱帯型ゴマが伸長しやすい特性を有するのは明らかである。しかし，このような熱帯型ゴマも乾燥地では1m前後の草丈に抑制されている。熱帯型が乾燥地において最も適応したタイプであるため残存し，乾燥条件が多様性を規制しているとも推測されるが，南部のゴマが形態的な多様性に乏しい背景，要因等については残された課題である。

### 3) インドにおけるゴマの食文化

ゴマは古い作物でさまざまな伝統的調理に用いられている。甘いお菓子，チエットニイ(トウガラシの入った辛い付け合せ)，野菜や肉料理のためのマサラ(香辛料ミックス)，ロティ(無発酵パン)やお菓子のトッピングなどの食品・用途を聞き取ることができた。また，ゴマは1月14日のサンクランテのお祭りとも結びつき，この祭りではゴマは欠くことのできない食品素材となっている。このような食文化のもとで自家用，あるいは集落の特定の農家で栽培されている例が多く，1筆の畑面積は小さいがそこで遺伝資源を収集することができた。

ゴマ油が選択的に調理に使われるのはマンゴーのピクルス(トウガラシ味の漬物)であるが，このための消費量は量的には多くはないと思われる。ほかにはゴマ油でなければならない伝統的な調理はないようである。

加工食用油脂では，パナスピティ(植物性硬化油)を生産するときゴマ油を最低5%混ぜることが義務づけられており，そのためのゴマ油の消費量が5~10万トンといわれる<sup>5)</sup>。

以上がゴマでなければならない用途で，これら以外の一般油料としては，ゴマの収量が低

いという理由で大きな面積を栽培していたところがヒマワリやダイズに急速に置き換えられている。その意味では遺伝的侵食（genetic erosion）に直面している作物である。強い抗酸化性に示されるような他の油料作物にないゴマの優れた特性を考えると、今後も遺伝資源としてより広い収集、評価、保存が是非とも必要である。

### 5. 収集した遺伝資源の今後の取扱い

収集した遺伝資源は NBPGR と日本側とに折半した。日本に持ち帰った遺伝資源は植物防疫検査後、2つに分け、一部をオリジナルシードとして農業生物資源研究所の貯蔵施設に保存し、他を農業研究センターで所持し、特性評価を行うとともに増殖し、ジーンバンクに移管する。

### 6. 所感

今まで、ほとんど情報の得られていなかったインドにおいて、NBPGR と共同でデカン高原北部からデリーに至るゴマ栽培地域を調査し、探索収集を行うことができたことは非常に好運であった。

インドは世界最大のゴマ栽培国であるが、油料用としてはゴマの収量が低いことからヒマワリ、ダイズに代わりつつあり、栽培が減少していることを知った。また、農家によっては3朔型のゴマを選抜しているところがあることを知った。栽培の減少により在来型のゴマが失われ、また、一部選抜等が行われる中で、原始型のゴマから改良ゴマへと変遷してゆくことが考えられる。このような状況のなかで短期間であったが、貴重なゴマ遺伝資源を収集することができたと確信し、今後の特性評価のなかで抗酸化性物質等の高い有用素材が見いだされることを期待している。

本探索では野生種あるいは雑草性のようなものを3点収集したが、デカン高原南部やインド北西部のオリッサ州では野生種および雑草性のゴマが分布しているとの情報を得た。今後、栽培種、野生種を問わずより広い範囲でさらに探索収集することが望まれる。

NBPGRとの情報交換のなかで、インドは独自に遺伝資源の探索収集の年次計画を持っており、それと日本の計画とがジョイントできるならば、今後も共同探索の受け入れは可能とのことであった。年次計画を立案する際に事前折衝が重要であることを示唆するものである。

収集遺伝資源の日本への持ち帰りに当たって、移出側のインドにおける植物防疫に予想外の日数（5日）を要し、実際の探索日数を当初計画より短縮せざるを得なかった。日本の植物防疫検査を例に、短時間で行うよう要請したが、インドの植物防疫検査における規則とのことで受け入れられなかった。インドにおける探索ではこの日数を予め計画に入れておく必要がある。

### おわりに

本探索はインド NBPGR との共同探索として実施できたが、その実現のために尽力頂いた NBPGR 所長の R. S. RANA 博士に感謝申しあげます。

また、私たちの派遣のためにご尽力頂いた連絡調整課をはじめ関係各位にお礼申し上げます。

## [Notes]

1) Sample: P(population), In(individual)

2) Status: ① wild, ② weedy, ③ landrace, ④ improved, ⑤ breeder's line, ⑥ others

3) Topography: ① swamp, ② flood plain, ③ plain level, ④ undulating, ⑤ hilly ⑥ mountainous, ⑦ others

4) Site: ① level, ② slope, ③ summit, ④ depression

5) Drainage: ① poor, ② moderate, ③ good, ④ excessive

## [Abbreviation]

HNB: high node branching

LNB: low node branching

MNB: middle node branching

C/LA: capsule(s) per leaf axis

C/C: carpel(s) per capsule

cmH: plant height (cm)

cmLC: height of lowest capsule (cm)

ULL: uni-lobed leaf

3LL: tri-lobed leaf
